

[0085]

ABSTRACT OF THE DISCLOSURE

[0086] A system for removing gaps from streams of packets is provided. The system includes a packet splitter, a header buffer, a data buffer, and a packet combiner. The packet splitter receives the packets. Each of the packets includes a packet header and packet data. The packet splitter separates the packet header from the packet data for each of the packets. The header buffer stores the packet headers and the data buffer stores the packet data. The packet combiner reassembles the packets from the packet headers in the header buffer and the packet data in the data buffer and removes gaps from the reassembled packets.
